
Subject: kernel errors in syslog

Posted by [barf](#) on Thu, 05 Jul 2007 03:29:41 GMT

Hello everyone,

I'm frequently seeing errors in the logs upon VE start and during a heavy I/O (cp /something /somewhere on HN) I had a lockup and kernel panic but did not have a serial console attached to catch the panic message sorry.

Is this a bug? I found http://bugzilla.openvz.org/show_bug.cgi?id=470 with similar problem but it says the bug is fixed(?)

the errors look like this:

```
> Jul 6 02:20:09 server01 kernel: lockd_down: no lockd running.  
> Jul 6 02:20:11 server01 kernel: VE: 104: stopped  
> Jul 6 02:20:12 server01 kernel: VE: 104: started  
> Jul 6 02:20:26 server01 kernel: kernel_thread call inside VE

some other info:

server01:~# uname -a

Linux server01 2.6.18-028stab035.1-ovz #1 Wed Jun 13 21:25:54 CEST 2007 i686 GNU/Linux

server01:~# cat /proc/version

Linux version 2.6.18-028stab035.1-ovz (tsd@debian.systs.org) (gcc version 4.1.2 20061115

(prerelease) (Debian 4.1.1-21) #1 Wed Jun 13 21:25:54 CEST 2007

using debian etch with packages from sysst.org - are the CentOS kernels more stable?

Thanks,
Stuart.
