Hello.

If you use the venet implementation you don't need to make all those aliases to the eth0 interface.

The venet0 interface behaves like an aliased interface all ready.

Just put the VE's in a separate subnet.

The question is "Why do you want such a setup?".

Why do double nat (have a private ip address space IN a private ip address space) ?

You can put the HN on the internet using a public ip on the eth0 interface and have the VE's in a private ip address space and do SNAT/DNAT for them.
