Hi,

Actually I have a couple of other servers with CentOS 4 installed and kernel 2.6.18. I meant to install that kernel because it is newer and because there's a bug on the current kernel that doesn't allow me to use quota inside a VPS.

I could ask for a Reinstall to CentOS 5, but I haven't found anything here that says it works with CentOS 5. What would be better? CentOS 5 or Fedora Core 4?

Regards,

Eugenio Pacheco
