I'd really rather avoid having "resource" in the name, since it's meant to be for any kind of behaviour modification on groups of processes. resource control is just one of those, albeit a significant one.

Referring to the process tracking as "task containers" or "process containers" while continuing to refer to the overall effort including namespaces and userspace support as "containers" seems reasonably unambiguous to me.

- >     specific containers

The userspace RBCE should probably be in a separate bullet rather than under "specific containers".

Paul
