I think per container swap is interesting

Well, it depends on how you define ugly. We could do something like the namespace approach, have something like

```
struct mem_container_ptrs {  
    swap_list;  
    mem_container_ptr;  
};
```

Although, I agree that per container swap is important, I feel that we should add in the functionality, once we have basic page based memory controller. It would make the whole setup easier to test for functionality and performance.
