Well, I don't quite understand why do you ask, but not try to setup it   There are some articles at
http://wiki.openvz.org about networkin in OVZ environment.

Here I explain venet networking principles. When you perform `vzctl set 101 --ipadd 10.0.0.101
--save` command VE 101 obtains venet interface. This interface is point-to-pointly connected to
venet interface at HN. As these interfaces are connected in point-to-point manner, subnet
(netmask) is not pertinent for them.
All other VEs, e.g. VE102 will be added in the same style:

```
    10.0.0.101
_____  venet      venet _____    eth
VE101|--------------------|HN |-------
             |
   172.0.0.102   |
_____  venet      |
VE102|-------------
```
 The only thing you should do: create an appropriate routing at HN from venet to eth. BTW, some
routing is set automatically by vzctl: from HN to VEs/VEs.

HTH,
Vasily.
