Hello,

Well, as you know, beeing on HN you can see \_all\_ the processes on HN: even that one which are in VE. Consequently, in certain circumstances killproc on HN can kill processes in VEs, because it doesn't now, that these processes are in VEs, but not on HN.

I suppose you to modify killproc procedure on HN in such way: check that the process to kill - is on HN (in VE0). You can use vzpid tool for it:

```
# vzpid 307
```

| Pid | VEID | Name |
|-----|------|------|
| 307 | 0    | bash |

```
# vzpid 519
```

| Pid | VEID | Name |
|-----|------|------|
| 519 | 101  | atd  |

HTH,

Vasily
