What alticon-brian suggested worked for us.

Basically, we just stopped the VPS, moved over the .conf file, tarred up the /vz/private/VPSID and /vz/root/VPSID directories (the latter just to make sure the directory existed on the new system) and then started the VPS on the new system. Connectivity seems fine and there haven't been any obvious problems.

Also, we renamed the .conf file on the original server to VPSID.migrated - keeping it around can cause warnings about the VPS's IP being used by another system on Commercial Virtuozzo at least, so we figured it best to just rename the file.
