--ipadd does not work properly. As you can see from my --ipadd command there is a subnetmask error it looks like:

```
[root@host06 ~]# vzctl set 601 --ipadd xxx.yyy.247.151 --save
Adding IP address(es): xxx.yyy.247.151
SIOCADDRT: Network is unreachable
Configure meminfo: 49152
Saved parameters for VE 601
[root@host06 ~]#
```

Any ideas? Can I do something like --ipadd xxx.yyy.247.151 --netmask 255.255.255.128 ?

Thanks in advance!
