Hi again,

My problem is, that my network-speed is very slow.
user_beancounters gives no failcounts.

My ip-forwarding seems to be disabled:

```
#cat /proc/sys/net/ipv4/ip_forward  
0
```

sysctl looks alright for me:

```
# cat /etc/sysctl.conf  
#  
# /etc/sysctl.conf - Configuration file for setting system variables  
# See sysctl.conf (5) for information.  
#
```

```
#kernel.domainname = example.com  
#net/ipv4/icmp_echo_ignore_broadcasts=1
```

```
# Uncomment the following to stop low-level messages on console  
#kernel.printk = 4 4 1 7
```

```
#####3  
# Functions previously found in netbase  
#
```

```
# Uncomment the next line to enable Spoof protection (reverse-path filter)  
#net.ipv4.conf.default.rp_filter=1
```

```
# Uncomment the next line to enable TCP/IP SYN cookies  
#net.ipv4.tcp_syncookies=1
```

```
# Uncomment the next line to enable packet forwarding for IPv4  
#net.ipv4.conf.default.forwarding=1
```

```
# Uncomment the next line to enable packet forwarding for IPv6  
#net.ipv6.conf.default.forwarding=1
```

```
#-- OpenVZ begin --#
```

```
# On Hardware Node we generally need  
# packet forwarding enabled and proxy arp disabled  
net.ipv4.conf.default.forwarding=1  
net.ipv4.conf.default.proxy_arp = 0
```

```
# Enables source route verification
```

```
net.ipv4.conf.all.rp_filter = 1
```

```
# Enables the magic-sysrq key  
kernel.sysrq = 1
```

```
# TCP Explicit Congestion Notification  
#net.ipv4.tcp_ecn = 0
```

```
# we do not want all our interfaces to send redirects  
net.ipv4.conf.default.send_redirects = 1  
net.ipv4.conf.all.send_redirects = 0
```

```
## OpenVZ end ##
```

How can i enable forwarding?

And is this maybe the problem, wich makes my network-speed slow?
