Vasily,

Quote:IMHO it is the same directory, /etc/vz/conf uses symlinks

I checked this on Debian, and it is not a symlink, and the /etc/sysconfig directory does not exist.

The veid.start scrip has to be on /etc/vz/conf. I confirmed this.

Quote:I'm not sure that understand you correctly: EXTERNAL_SCRIPT is executed to configure veth interface and on VE start it executed after <ve>.mount but before <ve>.start script.

Thanks for clarifying this. It should be on the OpenVZ Users Manual, for completeness.

Thanks again,

Gustavo.
