First i tried to install from the following "official" suse repo:

[http://ftp.opensuse.org/pub/opensuse/repositories/home:/open\\_vz/openSUSE\\_10.2/x86\\_64/](http://ftp.opensuse.org/pub/opensuse/repositories/home:/open_vz/openSUSE_10.2/x86_64/)

It just totally hanged out during boot, however it loaded almost everything, mounted the file systems, started the daemons, etc but afterwards it just stopped i had to hard reset the computer because even ctrl+alt+del didn't work.

After that i tried to use kernel from

[http://download.openvz.org/kernel/branches/2.6.18/stable/kernel-2.6.18-ovz028stab035.1.x86\\_64.rpm](http://download.openvz.org/kernel/branches/2.6.18/stable/kernel-2.6.18-ovz028stab035.1.x86_64.rpm)

i installed it with "rpm -ivh -nodeps kernel..."

with this one i was able to boot but the boot was full with errors and in KDE the mouse didn't worked at all, however the keyboard was ok, so i switch back to a console but i wasn't able to do anything...

I will send a more detailed error report on this second case, just first i have to reboot

Anyway, thank you for your effort helping me to solve this issue.
