Okay!

I did:

```
rpm -ivh ovzkernel-2.6.18-8.1.4.el5.028stab035.1.x86_64.rpm --nodeps
```

and the result was:

```
/var/tmp/rpm-tmp.69793: line 6: /sbin/new-kernel-pkg: No such file or directory  
error: %post(ovzkernel-2.6.18-8.1.4.el5.028stab035.1.x86_64) scriptlet failed, exit status 127
```

but `rpm -qa | grep kernel` says it is installed so now i'm going to do a reboot and come back tell you what happend!

See you soon and thank you guys all for your help!
