1. OpenVZ Kernel problem: (on openSUSE 10.2)

The same goes for me. I'm also Suser that wants to get a good OpenVZ, SUSE-compatible kernel, but unfortunately I get only a dozen of non-working kernels.

The RHEL5 kernel is one of them - on SUSE, modprobe *cannot* find it's own modules, even I know they exist.
Some modules metadata lacks in the kernel, so it prevents from SUSE Linux to function.

BTW: is "initrd" should be inside the RPM, or the user needs to create one ?

2. integrating OpenVZ with openSUSE - I really would like to see good integration between openSUSE and openVZ.
