Hello all.

I have a couple questions concerning the kernel visible from inside the VEs:

On my hardware node the installed openvz kernel is 2.6.18-ovz028stab023.1.

Inside the VEs the kernel reported by `uname -a` is 2.6.9.

1) Why isn't that kernel the same as the one on the HN (2.6.18-ovz028stab023.1) ?

2) Is there any way I can 'forge' the kernel version reported by `uname` inside the VEs (to return 2.6.20 for example) ?

Thank you.
