Hello,

I think it will be a good solution to continue with webmin openvz module. I see some advantages of developing modules for webmin:

1. Webmin is quite popular tool. It's easy to install and configure and I guess it's quite stable.
2. Webmin modules are written on perl. I found it very easy to add new functionality. I added some new test-menus just in couple of hours and it looks great! Also any user can fix a problem quickly if something will be wrong.
3. Again, you are writing just a perl module, you don't need to know anything about package requirements, C-compiler, libraries, configure, Xt and so on
4. You can use standard webmin services in your module.

maybe something else...

If you are going to continue to develop it, please write a letter to the author. It could be great, if you combine your efforts and write powerful tool.
