
Subject: [PATCH 03/10] Task Containers(V11): Add fork()/exit() hooks

Posted by [Paul Menage](#) on Fri, 20 Jul 2007 18:31:55 GMT

[View Forum Message](#) <> [Reply to Message](#)

This patch adds the necessary hooks to the fork() and exit() paths to ensure that new children inherit their parent's container assignments, and that exiting processes release reference counts on their containers.

+/**
+ * container_exit - detach container from exiting task
+ * @tsk: pointer to task_struct of exiting process
+ *
+ * Description: Detach container from @tsk and release it.
+ *
+ * Note that containers marked notify_on_release force every task in
+ * them to take the global container_mutex mutex when exiting.
+ * This could impact scaling on very large systems. Be reluctant to
+ * use notify_on_release containers where very high task exit scaling
+ * is required on large systems.
+ *
+ * the_top_container_hack:
+ *
+ * Set the exiting tasks container to the root container (top_container).
+ *
+ * We call container_exit() while the task is still competent to
+ * handle notify_on_release(), then leave the task attached to the
+ * root container in each hierarchy for the remainder of its exit.

```

```

+ *
+ * To do this properly, we would increment the reference count on
+ * top_container, and near the very end of the kernel/exit.c do_exit()
+ * code we would add a second container function call, to drop that
+ * reference. This would just create an unnecessary hot spot on
+ * the top_container reference count, to no avail.
+ *
+ * Normally, holding a reference to a container without bumping its
+ * count is unsafe. The container could go away, or someone could
+ * attach us to a different container, decrementing the count on
+ * the first container that we never incremented. But in this case,
+ * top_container isn't going away, and either task has PF_EXITING set,
+ * which wards off any attach_task() attempts, or task is a failed
+ * fork, never visible to attach_task.
+ *
