Subject: Upgrading hardware (memory) re-write 0.conf for HN VE0?

I recently upgraded my dual xeon 2.4GHz machine from 2GB of RAM to 3GB. The system (as seen through meminfo/top, etc) sees all of the RAM and uses it properly.

My question is with regards to VE0, it still has limits that are all the 2GB limits. Do I need to rewrite this file with the new/proper 3GB limits to have everything function properly, or as my HN never uses that much memory should I have no concern for it?
