Subject: Re: Upgrading hardware (memory) re-write 0.conf for HN VE0?
Posted by rickb on Mon, 23 Jul 2007 03:10:50 GMT

ve0 can never have a ubc failure. the kernel sources explicitly ensure this. you may be referring to ve0's memory guarantee? if so, 2GB would be more then you need as applications should be run in the VEs. maybe paste your config so that we can see clearly.

adding more system memory will not edit any configs.
