Anything new to this subject?

I going to move a couple of systems to OpenVZ VPS, and feel it is a little odd to start with centos-4 when centos-5 has been ready for some time.

The problem is that I dont have enough knowledge or experince to create the metadata template my self.

I have found the centos-5-i386-XXX.tar.gz and is able to install a centos-5 system, but without the abillity to run vzyum install or update (because of lacking metadata) it is useless.

Any pointers to contributed centos-5 metadata ?

/Thomas
