Hey steve

I have tried your RPM.

Build the cache files work fine.

The creation of the VPS went fine:

vzctl create 206 --ostemplate centos-5-i386-minimal Creating VE private area (centos-5-i386-minimal) Performing postcreate actions VE private area was created

and it seems like it will start:

vzctl start 206
Starting VE ...
VE is mounted
Setting CPU units: 1000
VE start in progress...

but I cant do any thing useful:

vzctl enter 206 enter into VE 206 failed Unable to open pty: No such file or directory

My host system is a FC5 with a /vmlinuz-2.6.18-8.el5.028stab027.1 kernel, and I have no problems creating and running centos 4 VPS.

I have tried to ssh into the centos 5 VPS but it says connection refused, which often means no sshd.

vzctl exec works, and ps shows:

vzctl exec 206 ps
PID TTY TIME CMD
1? 00:00:00 init
16341? 00:00:00 udevd
17608? 00:00:00 syslogd
17636? 00:00:00 ps

Any suggestions?

/Thomas
