Hey steve

I have tried your RPM.

Build the cache files work fine.

The creation of the VPS went fine:

```
# vzctl create 206 --ostemplate centos-5-i386-minimal
Creating VE private area (centos-5-i386-minimal)
Performing postcreate actions
VE private area was created
```

and it seems like it will start:

```
# vzctl start 206
Starting VE ...
VE is mounted
Setting CPU units: 1000
VE start in progress...
```

but I cant do any thing useful:

```
# vzctl enter 206
enter into VE 206 failed
Unable to open pty: No such file or directory
```

My host system is a FC5 with a /vmlinuz-2.6.18-8.el5.028stab027.1 kernel, and I have no problems creating and running centos 4 VPS.

I have tried to ssh into the centos 5 VPS but it says connection refused, which often means no sshd.

vzctl exec works, and ps shows:

```
# vzctl exec 206 ps
  PID TTY          TIME CMD
    1 ?        00:00:00 init
 16341 ?        00:00:00 udevd
 17608 ?        00:00:00 syslogd
 17636 ?        00:00:00 ps
```

Any suggestions?

/Thomas
