vzctl allows you to provide per-VE permissions for necessary devices.

From `man vzctl`:
     Device access management

   --devnodes device:r|w|rw|none
      Give the VE an access (r - read, w - write, rw - read
      write, none - no access) to a device designated by the
      special file /dev/device. Device file is created in VE
      by vzctl.

   --devices b|c:major:minor|all:[r|w|rw|none]
      Give the VE an access to a block or character device
      designated by its major and minor numbers. Device file
      have to be created manually.

Hope this helps.
