Yes, I was a little vague. I was just trying to hear some stories of what people have done.

I was thinking more of a way to combine all the nodes you have to have them to balance the load and then have some sort of shared storage, sort of like your idea. I supposed we could have some sort of redundant NFS solution and have all the nodes sharing the storage incase of one going down or being overloaded we could always start it up on another one and stop it on the original but would a gigabit NIC be fast enough to give me the disk speed I require?
