Okay. But what about the section "Moving Network Adapter to Virtual Private Server" on page 68 of the Chapter "Advanced Tasks" in the OpenVZ Users Guide? I've read that just after your reply and it says that there's a possibility for a VPS to directly access the physical network adapter. The following command would make that possible:

vzctl set 101 --netdev_add eth1 --save

It has some limitations though, one of them is that the device is only accessible to the VPS. Hardware node and other VPS's thus excluded.
