Thanks Vaverin for your contribution in finding a solution.

I've finally found the problem. At the very begin of my problems I copied the /etc/sysconfig/i18n file from the OpenVZ Host to the exact same location on the VPS. I didn't understand why this file was missing on the VPS and forgot all about it in my quest for a sollution.

The solution I found is as follows:

- 1) remove the /etc/sysconfig/i18n on the VPS
- 2) (on the VPS)# localedef -i en_US -f ISO-8859-1 en_US

Check:

```
# locale -a
```

Instead of the previous error messages I get the following output:

```
C
POSIX
en_US
en_US.iso88591
```

Everything is oke now, but i still do not know why the file i18n doesn't exist on the VPS?

Anybody?

Regards,

Marc
