hi,

i am completely puzzled by the configuration options for memory. i am looking for a way to use 6 VM's sharing the resources of an P4 2GHz with 1 GB Ram and 2 GB Swap. i keep having trouble with error messages like "cannot allocate memory". but only sometimes and not other times, its really frustrating not to find a setting which keeps everything going. to make this clear, i am NOT looking for a all-resources divided by 6 solution, i am more looking for a nice way to SHARE resources between all 6 VM's. the very strange thing is that the VM's do not use any swap.

i am looking forward to any help.

PS: if i do everything on an old cobalt raq with 32MB Ram what i am doing on the VM, i never get a "cannot allocate memory", everything just takes ages. can that behavior somehow be replicated on the VM's ?

regards

Jan
