a little more background info

Motherboard: SuperMicro PDSMA  
CPU: Intel q6600  
Ram: 4 x 2GB DDR2-667  
OS: CentOS 5.0 x32

From IP console the system shows absolutely no errors, kernel does not panic. The actual console sits at the login prompt with a cursor that blinks slightly faster than normal.

I can not attribute this to a hardware problem as this has happened with 3 nodes that I've tested with. There appear to be minimal DIFF's between the PAE, Enterprise and non-pae kernels I don't think it's a kernel issue but possibly something somewhere else.

Anyone have any ideas?
