i followed wiki.openvz.org/Quick_installation all the way to wiki.openvz.org/VE_creation with no problems, creating a VE 101 and entered and exited the VE 101 no probs

i followed the procedure and was successful creating a VE using both [centos-4-i386-minimal.tar.gz](#) and [centos-5-i386-default.tar.gz](#)

my remote server (twin dual-core 2GB RAM CentOS 5 i386) has 16 IPs assigned by my host and both times i assigned a public IP to the VE

my problem is i cannot ssh into the new VE, there appears to be no network connection in the VE (i disabled iptables incase) must i add something to the hardware node network config? or must i further configure the VE to see the hardware eth0?

plz do you have advice? i am looking to set up many VE each with a public IP. i searched the forum but didnt find anything i recognised
