A program in a VE is complaining that it can't open /dev/fd/3

From reading, it appears that this is the equivalent of asking to open something with a file descriptor of 3. So I guess that the devices option on vzctl isn't going to help me here.

I also find that whilst I have made /dev/hdc available to my VE, I can't mount the cdrom. It tells me

mount: unknown filesystem type 'udf'

or

mount: unknown filesystem type 'iso9660'

depending on what I enter in the /etc/fstab.

My host OS is Debian etch, by VE is using a Debian etch template.

This has had me going around in circles for some time :-(

Steve
