centos5 and openvz works fine. If you read the documentation, you will discover you need to enable packet forwarding..

```
echo '1' > /proc/sys/net/ipv4/ip_forward
```

I recommend you read the entire pdf documentation as the challenges in administering a system will only become more advanced.

This forum and community is very well supported, just look at the helpful responses everyone gets. But, the poster needs to do their duty and at least understand the basics of how openvz works.

the HN acts as a router, you need packet forwarding enabled.

Rick
