ok so what am i guilty of? being a n00b. well consider this nOOb well roasted and smacked and everything you want to do to me. what a great experience this forum is

still i have the job to configure this server with OpenVZ

thank you very much for your advice, i will abandon the wiki and use the pdf. thanks for the help friend

EDIT: just because i never set networking on a linux box does not mean i know nothing, it means only i rent remote servers and the network config is done by the host

is going to be real fun when after i figure out how to do it alone, and i return here to deliver a critique of the poor wiki documentation that has on your own admission miserably wasted my time and money (that re-install cost me 99 euro) and let me guess that is much less than a 1 year support contract from OpenVZ if they could be bothered to check their mail

i am owner and admin on sites with 40,000+ active members on a single site, i understand forums, sry if that poster set me off but it is frustrating because the outlook is now 72 hours before a reply from any dev or staff member of the forum who can take the issue in hand. a virgin CentOS 5 server failed to work OpenVZ when precisely following the procedure in the Official Installation Guide
