Dude,

Ok, after logging into the machine... I have a better idea of what the problem is.

The NIC on your hardware node has been configured to answer as multiple addresses. If you do an ifconfig on the hardware node you'll see exactly what I'm talking about. It is configured with 10 different IP addresses - eth0, eth0:0 - eth0:9. You need to totally get rid of the virtual interfaces (or whatever the proper term for them is) because OpenVZ will handle all of the interfaces of your VPSes in its own way.

So why it isn't working is because your hardware node NIC has said that it will answer those IPs. You just happen to have a VPS assigned the same IP address as one of the virtual interfaces on your hardware node NIC... and I'm guessing that the race to answer is always one by the hardware node.

Get rid of those virtual interfaces and it'll have a lot better chance of working.

TYL, Scott
