So I'm trying to get the Centos5 template installed on Centos5 and with the current OVZ toolset installed via Yum, I'm getting:

```
rpm -ivh vztmpl-centos-5-2.0-2.i386.rpm
```

error: Failed dependencies:

 vzrpm43 is needed by vztmpl-centos-5-2.0-2.i386

It seems that using "--nodeps" will get me past this but if someone could post the SRPM, I can try to get this cleaned up and maybe we can get it posted to the Wiki.

Anyway.. I'm using the one template file included in this thread and so far running vzpkgcache seems to be ok.
