unfortunately that would require me to modify every single process that we spawn...

Anyone else have any ideas?

Edit: I tried recreating vzctl calls so that I could just use execve as though I were in the vps but that also failed.

```
syscall(511, 101);  
env_create.veid=101;  
env_create.flags=VE_ENTER;  
fd=open("/dev/vzctl", O_RDWR);  
ioctl(fd, VZCTL_ENV_CREATE, &env_create);  
close(fd);
```

The box ended up hardlocking...
