ve-vps.basic.conf-sample appears to have an insane values here:-
VMGUARPAGES="6144:2147483647"
PRIVVMPAGES="49152:53575"

vzsplit on a server with 2GB RAM split 16 ways gives:-
VMGUARPAGES="310949:2147483647"
PRIVVMPAGES="310949:342043"

vzsplit on a server with 2GB RAM split 32 ways gives:-
VMGUARPAGES="45759:2147483647"
PRIVVMPAGES="274554:302009"

the default config cannot run apache, mysql and ssh without constant '... fork: Cannot allocate memory' errors

i dont know how you guys are using your VE's? for playing pong?

i have to say after my experience of using it for a week i love OpenZV it is one of the best pieces of software i have ever happened upon, right up there with nx it is going to drive a revolution
