I run my primary desktop environment out of a VE. I am not sure about CentOS, but I use CentOS on my HN and Debian Etch for the VE on which I run my desktop system. I also use push/pull with VNC to drag a desktop on this same machine to my office, my house, or hotels when I am not at home. It works precisely like any other VNC installation and I haven't had any problems with it what-so-ever. VNC was the choice for me as I didn't have to install anything locally (as I can use java-VNC through browser @ hotels w/o having to do any work on their computers to change settings or install anything).

I also have run desktops out of VE's based on Gentoo & Slackware (12) without any troubles either, so I'm surprised that CentOS has any troubles with this. That said, I'm still running CentOS 4.5 everywhere and not 5.
