Subject: *solved* vzmigrate arp issues?

I was testing the vzmigrate function. After the migration the old HN could not reach the new VE location and I could not reach the VE remotely. The new HN had no problems. I then migrated the VE back and everything is happy.

I suspect an arp issue in the switch that connects both servers and the Internet. I don't have my own switch in place yet, so I can't do an arp flush. Does this sound familiar and is there a work around?

Thanks
