Just saw that. I host my own VPSes, this was the first hub that I hosted. I always limit only space on my VPSes, at rest, it has access to 8 cores, 8 GB RAM ... how would I go to upgrading to 2.6.21 ?? I tried to downgrade to 2.6.16, but it had some dependencies that couldn't go with a downgrade.

My kernel : 2.6.18-ovz028stab039.1-enterprise .
