Subject: Re: apache2: access denied
Posted by ggonzalez on Wed, 05 Sep 2007 13:15:39 GMT

I have looked and looked, and can't find a good reason why apache2 is not willing to serve the pages. Although it says that it is forbidden to access these pages, it is not. It is the standard configuration, where the root of the site (/var/www) has Allow from all. And, when tried this same installation procedure on another machine (either real or VMware), apache2 serves those pages correctly.

I have even created a new VE, with venet (not veth), and the results are the same.

Is somebody in this forum using apache2 within a VE?
What special tricks are needed for this to work?

Thanks a lot for any help.

Best regards,
Gustavo.
