Hello,

LBD config option is enabled in all OpenVZ kernels. And you can use big block devices. But with partitions - its a bit harder.

If you want to use common MBR (Master Boot Record) Partion Table (which fdisk operates with), then the size of partion can't be more then 2TB. piavlo offered you to use GPT (GUID Partion Table) andin fact it allows you to use big partions.

HTH,
Vasily
