mastersherin wrote on Sun, 09 September 2007 03:25# lsmod |grep -i vxdquota
Also which kernel you using ,rpm or compiled kernel

```
root@vps1 [~]# lsmod |grep -i vxdquota
vxdquota          38496  6 [permanent]
vxdev             3584  4 vxnetdev,vxethdev,vxdquota,vxmon
```

Outside the vps, it's installed, i didn't tested inside one of the vps's at the webserver. The kernel i've named previously, it's vxkernel: Linux 2.6.9-023stab016.2-smp
I'm on a x86_64 GNU/Linux (CentOS 5), the odd thing is that I've other 3 webserver installed the exact same way.. that DO work. There must be something we're not seeing in here.
