Just for readability. Maybe my brain is defective, but I just don't parse the `foo?bar:baz` stuff very well.

Something like

```
#define UIDHASH_BITS CONFIG_UID_HASH_BITS
```

```
config UID_HASH_BITS
```

```
int
```

```
default 3 if BASE_SMALL
```

```
default 8
```

But, I guess the incentive is pretty small when there are really only two values, and the logic is extremely simple.

```

I know, I know. ;) But, a lot of these definitions were from before we had our nice, pretty Kconfig language. I don't think it's much of a crime to break tradition on these.

Anyway, it's not a big deal either way.
