I've not checked parameters like guid and so on - it is only a test machine and does not matter.

Ähm the length of the string is def. allocated - i've also checked it by top - i can see, that perl does allocate 45% of RAM (next time top refresh the process is mostly killed cause of out of memory and the fact that the sting is always doubled).

But i think we'll discuss that in my own thread here:

<http://forum.openvz.org/index.php?t=msg&goto=1666>

sorry for my cross posting.
