disaster,

what VPS OS do you use?

I will recheck it tomorrow with the script you supplied for a string, but it looks quite correct.

Perl maps too much of an address space. This is normal.

Please, note, `privvmpages` and `vmguarpages` are not a real amount of `_physical_` memory. This is size of an allocated `_address_ _space_`, which can `_potentially_` allocate the pages. This is why, usual applications can report less RAM available, because address space is used for `glibc/elfs/files` etc.
