Let me give you my \$0.02:)

To provide any parameter on module loading, the best place would be /etc/modprobe.conf file. In our case, to enable connection tracking for the host system, add the following line to /etc/modprobe.conf:

options ip\_conntrack ip\_conntrack\_enable\_ve0=1

After that, you need to reload the module, i.e. modprobe -r ip\_conntract (check that module was really unloaded: /sbin/lsmod | grep conntr) modprobe ip\_conntrack
