You have announced at LKML that Linux-VServer now uses the stuff that was merged in 2.6.19-rc1, haven't you? I suppose that means you are using IPC namespaces from mainstream? Isn't that considered testing? Or you don't test Linux-VServer? Please clarify, I'm a bit lost here.

Speaking of OpenVZ, as Kirill Korotaev said before we have backported all that to 2.6.18 back in September and are using it since then. And yes, we found a bug in IPC namespaces, and fix from Pavel Emelyanov has made it to 2.6.19-rc5 (see commit [c7e12b838989b0e432c7a1cdf1e6c6fd936007f6](#) to linux-2.6-git).
