I know I've asked this before (and I know I'm going to ask it again),
 but why do we need both task pgrp() and process group() to both have
 similar-sounding names and both take the same kind of argument? :) This
 stuff really needs to get cleaned up. It makes reviewing these
 patches much harder.
We are phasing out process_group(), process_session() which return a
pid_t. I guess it also points to not having a special case for swapper.
In general, you should keep the hacks (which this is) to boot and
init-time stuff. If you can initialize a structure so that it plays
 nicely for the rest of its life, do that. Don't put special cases in
 common code that everybody will have to look at.

 Can you do some research and find out _why_ these are NULL, and why they
need to be kept NULL?
```

task_struct for swapper is initialized by hand (INIT_TASK, INIT_SIGNALS etc) but no struct pid is ever allocated and attached to the swapper. This is normally done in copy_process() and so is done for all other processes starting with pid_t = 1 (/sbin/init).

I am trying to understand if there is a history to it and if they need to be kept NULL.
