Quoting Srivatsa Vaddagiri (vatsa@in.ibm.com):

> Heavily based on Paul Menage's (inturn cpuset) work. The big difference
> is that the patch uses task->nsproxy to group tasks for resource control
> purpose (instead of task->containers).

Hi,

we've already had some trouble with nsproxy holding things with different lifetimes. As it happens the solution this time was to put the pid namespace where it belongs - not in nsproxy - so maybe moving this info into nsproxies will be fine, it just rings a warning bell.

This patch would be all the more reason to do

<http://lkml.org/lkml/2007/2/21/217>

first though, as 'exit_task_namespaces' becomes even more of a lie.

-serge

> The patch retains the same user interface as Paul Menage's patches. In
> particular, you can have multiple hierarchies, each hierarchy giving a
> different composition/view of task-groups.
