This is done in current patches.

> - virtual 'physical' limit should not cause

So what to do when virtual physical limit is hit?  
OOM-kill current task?

This is true for current implementation for  
booth - this patchset and OpenVZ beancounters.

If you sum up the physpages values for all containers  
you'll get the exact number of RAM pages used.

> - OOM handling on a per guest basis, i.e. some  
> out of memory condition in guest A must not  
> affect guest B

This is done in current patches.

Herbert, did you look at the patches before  
sending this mail or do you just want to  
'take part' in conversation w/o understanding  
of what is going on?
